

“The Most Tested Expansion Joints in The Industry”

Outdoors or Indoors We've Got You Covered

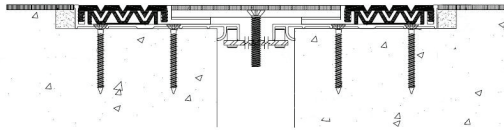

EMS is known throughout the construction industry for supplying high quality expansion joint systems for parking garages and open-air structures. However, we also offer a full line of architectural expansion joints intended for use in interior applications such as hospitals, airports, shopping malls, schools, etc.

In response to the needs of the industry, we have continued to expand our architectural product line. We offer one of the most complete selections of architectural joint systems in the industry, with multiple options for ceiling, wall and floor applications. Some of our floor and wall joint systems include elastomeric seals as well as metal covers. The seals are provided in various colors to accent the surrounding architecture. Our architectural product line maintains the same high quality standards as our exterior expansion joint products you have come to expect from EMS over the past 22-years.

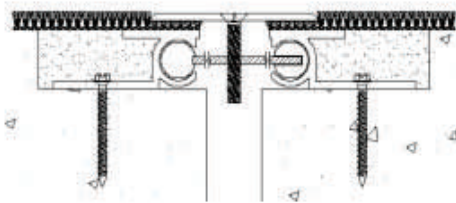

In addition to these interior joint system options, we also have a complete compliment of UL rated fire barrier systems for each joint system. One, two and three hour rated systems are available for various size joint openings and configurations. Contact EMS to discuss your specific application (indoor or outdoor) or visit our website at www.eriemetal.com.

EMS Goes Back To School

The month of August is when many college students pack up their belongings to head to universities and colleges to further their education. Most campuses and dormitories that are virtual ghost towns in the summer come back to life as thousands of college students return to campus, not to mention the alumni who come to visit the campus for football games and other college events.

This summer, EMS went back to school, too (or at least our products did). Our expansion joint systems were used at several colleges and universities for repair and rehabilitation of their parking garages. Our CR-Series expansion joint system was used for one of these projects where existing expansion joints were removed and replaced. The CR-Series is a winged system that uses an epoxy-based bedding compound to hold the wings in place while the header material (elastomeric concrete) is poured. The use of a bedding material assures that the wings adhere properly to the concrete. Our system also utilizes an aluminum clamping system we developed to hold the seal in place during installation to provide a smooth radiused edge for the elastomeric concrete. This clamping system also helps to assure that the seal is installed properly, preventing “mushrooming” of the seal that can occur when installed without clamps. *(Continued on back page)*

Another project involved replacing caulk sealant at the perimeter of the top level of a parking garage. Over time, the caulk that was used to fill in the expansion gap cracked and split. It was decided that a true expansion joint seal was more appropriate for this application. Our AR-Series was selected. It is similar in cross-section to the CR-Series, however, it does not have the wings that are used for the installation of the seal. The AR series expansion joint system works well in floor-to-wall or wall-to-wall applications and uses a lube adhesive to adhere the seal to the joint opening. The AR-Series seals can also be colored to match existing exterior surfaces (such as brick, sandstone, etc.) for applications where aesthetics are important.

To “learn” more about our products and the various applications they are used for, contact us or visit our website at www.eriemetal.com.

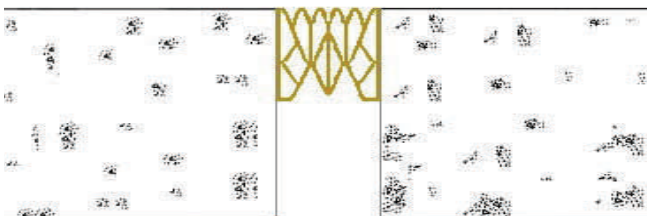

Our knowledgeable associates are ready to “educate” you about the various applications where our products have been used.
